PROFILE

I turn business problems into AI solutions that get deployed and actually used. Promoted through four roles in four years at Spotzer Digital — Sales → Team Lead → Sales Operations → AI Solutions Consultant — by building the solutions the business needed at each step. Hybrid profile: business understanding, end-to-end technical ownership (architecture, development, integration, deployment), and a track record of adoption by non-technical teams.

TECHNICAL SKILLS

AI agents & integrations: Agent design, MCP servers (design & deployment), REST APIs, n8n, LibreChat, Codex, Claude Code, prompt engineering for small self-hosted models

LLMs & model strategy: Frontier models (Claude, GPT, Gemini), local LLMs (LM Studio, vLLM, Ollama), benchmarking & selection per use case, RAG, prompt evaluation on real samples, guardrails & hallucination control

Deployment & self-hosting: Docker & Docker Compose, CI (GitHub Actions), Caddy, Render, WSL2, self-hosted model serving

Engineering: TypeScript, React / Vite, Node.js / Express, Python, SQLite, Supabase, MongoDB, Vitest / Playwright, Electron, Git

Business tools: Salesforce, Twenty CRM, Google Workspace (Drive, Calendar, Gmail APIs), Power BI, Tableau

EXPERIENCE

Spotzer Digital, Amsterdam — *promoted four times in four years*

AI Solutions Consultant | *Aug 2025 – Present*

- Own the full delivery cycle of AI solutions across sales, support, production, CRM and knowledge access: discovery, architecture, development, integration, deployment and enablement.
- Design AI agents connected to business tools and data (CRM, Google Workspace, support systems), with grounded outputs and human validation embedded in every flow.
- Benchmark and select models per use case: frontier APIs where capability drives value, self-hosted local models where customer data must stay in-house.
- Lead company-wide AI enablement on prompting, data security, hallucination control and agent creation.

Sales Operations Manager | *Jul 2024 – Aug 2025*

- Owned forecasting, market performance and strategy analysis; introduced the company's first AI-assisted processes into sales operations — the bridge to the AI role.

Team Leader Sales | *Sep 2023 – Jul 2024*

- Led and coached a sales team and streamlined sales-to-delivery handovers; CEO Award, Sep 2023.

Sales Market Leader — FR Market | *Apr 2022 – Oct 2023*

- Owned French-market sales through direct client engagement and tailored offers.

SELECTED AI PROJECTS

FreeScout AI Copilot · *support workspace, in production — sole designer & developer*

- **Problem:** support agents juggled tickets, call transcripts and AI tools across separate systems, with customer data at risk of third-party exposure.
- **Built:** full-stack workspace (React / TypeScript, Node / Express) unifying FreeScout tickets and call transcripts with contextual AI search, draft replies, per-mailbox HTML templates and business instructions, scheduled sends with a team calendar and a Cortex customer-brief tab — Google OAuth, per-operator identity, strict customer-context isolation before any model call, timeouts and rate limits on every outbound call.
- **Deployed & result:** Docker / Caddy with a Render blueprint; provider-agnostic (OpenAI-compatible endpoints, so local models can replace cloud APIs); 268 unit and integration tests, 26 Playwright end-to-end tests, CI; prompts benchmarked on 30 real customer e-mails; in use by the support team with human review before every send.

Perseus AI Platform · *internal platform, in production — LibreChat-based*

- **Problem:** give non-technical teams a safe, governed ChatGPT-like environment connected to company tools, instead of scattered personal AI accounts.
- **Built:** rebuilt LibreChat from source into an internal platform: full container stack with RAG, local model endpoint, MCP integrations (Google Workspace, Atlassian, Gmail), an agent catalogue with search and access rules, resilient duplicate detection, and guided agent creation for non-technical users.
- **Result:** business teams create and reuse governed agents on one platform, with privacy and long-term scalability built in.

Docflow · *document governance portal — V1 delivered, connected to Google Workspace*

- **Problem:** across thousands of Drive files nobody could tell which document was current, owned or approved, and AI tools had no governed corpus to read from.
- **Built:** Node.js / React portal with Google Drive as the single source of truth: admission with deterministic classification suggestions and versioning, SQLite registry with audit log, ACL-aware search by cited passages, deterministic knowledge capsules per audience, update sessions with Calendar / Meet and transcript import producing evidence-backed annotation proposals, local OCR (GLM-OCR via Ollama); optional model-written answers that never alter the retrieved passages.
- **Result:** 252 backend tests, Playwright end-to-end, CI; registry benchmarked at 1,000 and 3,000 documents; production preflight and Render blueprint ready.

Daily Spotz · *internal CRM replacing Salesforce — in progress since Sept 2026*

- Scoped and started an internal CRM on the open-source Twenty base: five project rules (extend rather than rewrite, no Enterprise spend, self-hosted, 100+ users, one isolated workspace per partner), WSL2 / Docker development stack, first core patches (multi-workspace limit, company branding) each documented with its proof; business logic planned as an SDK app with Vonage telephony webhooks.

Cortex conversation intelligence · *Athena platform — prompt engineering & integration*

- Inventoried and unified the LLM prompts of the Cortex pipeline (distill, identity, examine, compose, ask) for a small self-hosted model (Gemma 4 E4B), with a benchmark harness comparing prompt versions on real samples; integrated Cortex customer briefs into the support copilot and its reply prompts.

Call Coach · *desktop call-evaluation app*

- Electron / React app: audio import and transcription, AI-generated QA scoring templates (support, sales, compliance), multi-provider model choice with API keys kept out of the renderer, local history and CSV / JSON export.

AI enablement · *AI Day workshop and AI Explorer training site*

- Company-wide workshop (prompting, data security, hallucinations, RAG, MCP, hands-on agent creation) extended into a self-serve site: foundations, mindset, a prompting lab and a five-step agent-architect builder (purpose, knowledge, boundaries, persona, review).

Sales & ops tooling · *internal tools and method*

- WordPress quote calculator (60-service catalogue, tolerant search, WebMCP tools), deterministic client filter for order exports with a QA report, AI lead-enrichment workflows (deduplication, profiling, product matching, scoring), and horn-dev, a personal Claude Code plugin that enforces one delivery method across projects (task sheets, mandatory checks, verification reports).

EDUCATION

- Self-taught in AI engineering and software delivery — the projects above are the proof of work.
- Architecture studies, ENSAG, Grenoble — 2013–2015.
